

carevix[®]

Less pain and bleeding
during IUD insertion

Information leaflet Carevix

What is Carevix?

Carevix is a new device that can be used during the insertion of an IUD. Carevix uses gentle suction to grasp and stabilize the cervix. It is specifically designed to reduce pain and bleeding during the insertion of an IUD.

Why Carevix?

To insert an IUD, the cervix is held with a tenaculum; a surgical instrument commonly used in gynecology. This tenaculum has been used since 1899 and can cause pain and bleeding. Now, more than 125 years later, there is a new, more gentle alternative to the traditional tenaculum: Carevix. This woman-friendly device uses a suction cup to grasp and stabilize the cervix, causing less pain and bleeding than the traditional tenaculum.

Who is Carevix suitable for?

Having an IUD inserted can be a nerve-racking experience. Women are sometimes discouraged from using an IUD because of the fear of pain during insertion. Carevix has clinically proven to reduce pain and bleeding, taking a step towards less anxiety and more comfort during IUD insertion. Discuss the options with your healthcare provider.
